Interpret the output. During your submission, you will record the R-squared value, Significance F of the models, and p-values for each independent variable and explain what these values signify.

1. R-squared value = 0,27241446 - This means that 27% of the variance in the salary is explained by the model.
2 - Significance F = 0,23904424 - This is the p-value of the model. The value is less than 27%. So, the model is statistically significant.
3 - P-values: The p-value of "2021" is 0,103410283 and the p-value of "2022" is 0,970485114.
The p-value of one independent variable (2021) is less than 0.27 showing that only one (2021) have a statistically significant association.
